We live in a constantly changing world and consequence our belief and knowledge on the state of the world change over time [1, 2]. This notion of change manifests itself in application such as database updates etc. This raises two major questions to be answered: *when are we sure that we carry out change rationally?* and *How this can be implemented for a specific application* so far, these question have been dealt with separately: various philosophical works on belief dynamics [4, 3] giving the postulates to satisfied by a rational changes.

so, how knowledge base dynamics can provide an axiomatic characterization for view insertion in database and to explore relationship between belief dynamics and various non-monotonic approaches.
